

scibeamer

a template for scientific presentations

Anders Damsgaard

Unmodified template, 2016-07-12

Usage

`scibeamer` is a flexible template containing functions for quickly creating high-quality scientific presentations using *beamer*.

The functions in the `scibeamer` template are useful for including images scaled to frame size with optional references to image source publications.

Building presentations

Add images to the folder containing `scibeamer.tex` and change the `scibeamer.tex` to include the desired content, using the provided functions or standard *beamer* commands.

The included `Makefile` allows quick output PDF generation by typing `make` from the command line.

Examples

An example image frame using imageframe

An example unscaled image frame using `imageframescale`

An example image frame using imageframecite

Conclusions

- `scibeamer` adds to *beamer* functionality by providing functions for quickly creating image-based slides.
- Output files can be built as pdf (default), dvi, or eps using the provided Makefile.
- `scibeamer` is available at <https://github.com/anders-dc/scibeamer>.
